

CREMA-D: Crowd-Sourced Emotional Multimodal Actors Dataset

Cao, Cooper, Keutmann, Gur, Nenkova & Verma (2014), IEEE Trans. Affective Computing 5(4) · tags: video, face_valence, happy, angry, sad, dataset

CURATED SUMMARY — NOT a verbatim quote (full text is paywalled; this paragraph restates well-established, publicly-documented facts about the dataset, not the paper's original sentences)

CREMA-D is a controlled, balanced audio-visual dataset of 7,442 clips from 91 professional actors of diverse age, race and ethnicity, each speaking a fixed set of 12 sentences while acting out six discrete emotions (anger, disgust, fear, happiness, neutral, sadness) at multiple intensity levels.

Emotion labels were validated by crowd-sourced human raters (over 2,000 participants) who judged each clip from audio only, video only, and combined audio-visual presentation, producing both a categorical label and a continuous intensity rating per clip.

Relevance to MedOracle: this is the source dataset for Member 2's video branch. Note: the specific facial-action-unit terminology (AU12 = smile, AU1/2 = brow raise) used elsewhere in this project's grounding facts comes from Ekman & Friesen's Facial Action Coding System, not from Cao et al. directly — CREMA-D provides the labelled clips, FACS provides the action-unit vocabulary for describing what the face is doing.
